

Liquid fuels demand and supply model

Week 1 analytical pack

South Africa | Petrol and diesel

6 October 2026

Internal working discussion

Photo source: Royal Vopak | Terminal Durban | vopak.com

Locate fuel demand alongside the infrastructure serving it

Petrol + diesel sales by province | 2022, bn litres/year

Lease offers are not operating capacity. *Magdala RFP location narrative conflicts; briefing coordinate used. Jet excluded.

Source: DMPR 2022 sales; geoBoundaries/OCHA/MDB 2020 provinces (CC BY 3.0 IGO); operator sources on slide 7.

Key takeaways

01 • Demand concentrates in three provinces

Gauteng 6.81, KwaZulu-Natal 4.28 and Western Cape 3.93 bn litres represent 68.6% of reported sales.

02 • Regions have explicit boundaries

Eastern coast = EC + KZN; inland = GP, FS, LP, MP and NW; western coast = WC; other = NC. These are working groupings.

03 • Five Transnet lease offers added

Numbered triangles locate stranded depots offered for lease. Refurbishment, licensing and customer access remain conditional.

04 • Sales do not establish accessible volume

All four quarters of 2022 reconcile to national sales. Current demand, delivered cost and customer rights need separate evidence.

Track petrol and diesel sales by province over time

Annual provincial sales | 2013–2022, bn litres/year

Source: DMPR quarterly provincial sales extract; complete calendar years only. Petrol + diesel; jet excluded.

Key takeaways

01 • One line per province

Compare provincial demand histories on one shared scale. Petrol and diesel are combined; jet is excluded.

02 • Keep history separate from outlook

The latest complete year in this extract is 2022. These lines are reported sales, not a current-year forecast.

03 • Incomplete periods are excluded

2023 contains Q1 only. A partial year must not appear as a full-year demand collapse.

04 • Historical totals need reconciliation

Provincial and national series differ in 6 years. Largest gaps: 2013 +0.54 and 2018 -0.43 bn litres. Review the source workbooks.

Shape the provincial split between domestic fuel and imports

2022 sales totals | ILLUSTRATIVE domestic/import allocation

Units: bn litres/year. Imported/domestic segments are a scenario illustration, not measured provincial flows.

Key takeaways

01 • Demand totals are reported sales

Each complete bar matches its province's reported petrol + diesel sales in 2022. The source split is illustrative.

02 • Allocate by product, then aggregate

Use the existing example domestic shares separately for petrol and diesel. Provinces differ because their fuel mix differs.

03 • Provincial origins remain unverified

National production/imports do not tell us which province received each litre. Obtain refinery, port and onward customer flows.

04 • Refined fuel origin is the distinction

Locally refined fuel counts as domestic, including output made from imported crude. Imports here mean finished petrol/diesel.

Map conditional market access from Durban and Lesedi

Road-delivery accessibility | illustrative transport cost, R/litre

Example rate: R0.15/L dispatch + R0.002/L/km. Grey = unassessed.

Illustrative road cost only. Pipeline/rail access and commercial rights are not priced.

Source: Existing appendix routes; illustrative candidate connections, not verified catchments. Natural Earth 1:50m.

Key takeaways

01 • Durban: coastal and inland links

Road candidates connect coastal customers and inland transfers. Pipelines are separate supply connections.

02 • Lesedi: inland dispatch

Test receipt, dispatch, tanker cycles and customer destinations for connected inland markets.

03 • Lower cost means higher accessibility

Darker cells show lower example road-delivery cost from either facility. Pipe and rail lines remain context.

04 • Customer access is unverified

Contracts and competitors define the commercial envelope. Actual customer catchments are not supplied.

Separate demand, accessible volume and Vopak flows

Cost accessibility and market volumes | illustrative

Receipts 2.8 + 2.0 – transfer 1.8 = unique demand 3.0

Example rates: R0.15/L + R0.002/L/km. Grey = unassessed. Volumes: bn L/year.

Source: Illustrative CSVs and road transport rates; no actual Vopak throughput or quoted transport costs supplied.

Key takeaways

01 • National balance sets import needs

Demand of 21.0 less domestic production of 7.0 gives required imports of 14.0 in this illustration.

02 • Count unique customer demand once

Receipts of 2.8 at Durban and 2.0 at Lesedi include a shared 1.8 transfer. Unique demand served is 3.0.

03 • Candidate opportunity is conditional

The example commercial envelope is 8.5; current unique demand served is 3.0, leaving a candidate 5.5.

04 • Replace examples with evidence

Match regional demand, route constraints, customer flows and contracts by product, period and units.

Size each regional market and locate competing storage

All four regions | reported 2022 demand, bn litres/year

National total 21.90 bn L | petrol + diesel; jet excluded

To calculate share: unique Vopak customer deliveries / same-year regional demand.

Contestable demand needs route cost, compatible tanks, contracts and switching evidence.
Count Durban-Lesedi transfers once. Region boundaries are working groupings, not catchments.

[1] Vopak [2] Bidvest [3] Burgan [4] Shell [5] NERSA [6] Sasol [7] Transnet

Source: DMPR 2022 provincial petrol/diesel sales; public operator sources [1-7], checked 6 Oct 2026. Share not established.

Key takeaways | competitors

01 Eastern coast

Vopak: Durban [1]. Bidvest: Durban and Richards Bay [2]; mixed-product capacity.

Transnet: Ladysmith lease tanks [7].

02 Inland

Vopak: Lesedi [1]. Bidvest: Isando [2].

Sasol: Alrode, Pretoria West, Waltloo and Sasolburg [6].
Transnet: Tarlton / Jameson Park plus four lease sites [7].

03 Western coast

Burgan Cape: Cape Town petrol/diesel terminal [3].
Confirm current tank availability and customer access.

04 Other / Northern Cape

Regional operator inventory is incomplete. Extend it using Shell site notices [4] and NERSA licences / access records [5].

Compare published storage capacity by location

Storage stocks and lease opportunities | thousand m³

Published gross capacity | mixed product scopes

Transnet lease opportunities | enlarged scale; not operating supply

*Ladysmith: petrol/diesel working; excludes 0.474 intermixture. Other lease tank bases unspecified.

Unquantified: Bethlehem, Magdala, Sasol depots, Tarlton and Jameson Park. Stock ≠ throughput.

Key takeaways

01 • Durban leads this evidenced subset

Published Vopak and Bidvest gross capacity totals 799.6 thousand m³. Mixed products limit the fuel-only comparison.

02 • Five Transnet lease opportunities

Ladysmith, Standerton and Kroonstad have stated capacities. Bethlehem and Magdala remain unquantified, not zero.

03 • Capacity bases must stay visible

Ladysmith shows petrol/diesel working capacity. Kroonstad and Standerton have RFP-stated tank capacities; gross/working basis is unspecified.

04 • Lease offers require reactivation

Do not count these tanks as operating supply. Test refurbishment, receipt/dispatch, licensing and lease award. RFP close: 4 Dec 2026.

Agree priorities and next steps

Confirm demand, routes and access
