

# Liquid fuels demand and supply model

---

## Week 1 analytical pack

South Africa | Petrol and diesel

6 October 2026

Internal working discussion

Photo source: Royal Vopak | Terminal Durban | vopak.com

# Vopak's 2026 Liquid Fuels Outlook shows sustained import volumes, with growth from accessible customers (cost × service)

| Agenda          | SCR  | What the evidence shows                                                                                                                                                           | So what / story verdict                                                                                                                                     | Deep dives                   |
|-----------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Market baseline | S1   | Diesel drives imports; sales reports conflict<br>2024 net petrol/diesel imports: 13.078 bn L. Production, stocks, sales coverage and port allocation remain open.                 | Supported: imports are material.<br>Sustained future volumes remain a forecast case; the matched balance is open.                                           | <a href="#">3 / 6</a>        |
|                 | S2   | Demand sits around Vopak's footprint<br>GP, KZN and WC account for 68.6% of 2022 sales. Historical volumes were broadly steady; later provinces are estimates.                    | Supported: concentrated demand.<br>Focus on Gauteng/KZN; sales totals do not establish accessible customers.                                                | <a href="#">4 / 5</a>        |
| Market changes  | S/C3 | Demand drivers differ; L/M/H cases cover all key levers<br>Power, freight, fleet, prices, supply and customer access need explicit assumptions; fuel effects remain uncalibrated. | Partly supported: diesel generation has fallen.<br>Baseline, ample and tight worlds still need sourced assumptions and tested fuel/customer-volume effects. | <a href="#">7 / 9</a>        |
|                 | C4   | Supply change makes import needs conditional<br>Capacity has declined; redevelopment is conditional. Secunda/Natref product output and future cases remain open.                  | Supported: refining capacity fell.<br>Plant futures are conditional; capacity alone does not determine imports.                                             | <a href="#">8 / 9</a>        |
|                 | C5   | Alternative gateways challenge the same inland market<br>Matola and Walvis Bay have storage; their competitiveness depends on full costs, route capacity and access.              | Open: gateway competition.<br>No route winner without comparable cost, service and customer access.                                                         | <a href="#">10 / 11</a>      |
| Vopak outlook   | R6   | Market share of Vopak in Dbn and Lesedi<br>Vopak has an established storage footprint; its share of customer volumes remains to be quantified.                                    | Footprint established; volume share unquantified.<br>Unique deliveries and customer access establish served volumes.                                        | <a href="#">12 / 13 / 14</a> |
|                 | R7   | Potential scope for new investment?<br>Prioritise Durban/Lesedi customer flows. Additional storage follows secured volumes and a usable-capacity gap.                             | Conditional: win customers first.<br>Use existing assets; new storage needs secured flows and a usable-capacity gap.                                        | <a href="#">15 / 16 / 19</a> |

Note: S = Situation C = Complication R = Resolution | Every Henry storyboard prompt has a response on pages 20–22; open items remain open.

Source: Partner SA storyboard; SARS / Stats SA / operator evidence, 6 Oct 2026. Remaining gaps labelled.

Strictly Confidential

# S1. Diesel drives import volumes, while conflicting reports leave 2024 sales unresolved

## National petrol/diesel | 2024, billion litres

Production + imports – exports – stock build = consumption

Reported sales are a consumption proxy; production and stock changes are missing.

Net imports: petrol 3.081, diesel 9.997; combined 13.078 bn litres.

### Primary trade | SARS customs

Diesel imports 10.793 bn L.

Government rounds to 10.800; FIASA 14.793.

Use SARS; retain the source discrepancy.

### 2024 accounting remains open

Sales less net imports = 7.685 bn L.

Balancing requirement, not production.

Production, stocks and coverage unresolved.

## What the evidence shows

### 01 | Customs supports the trade selection

SARS records diesel imports of 10.793 and exports of 0.796 bn litres in 2024. Net imports are 9.997; use customs as the primary trade source.

### 02 | Reported sales remain a proxy

FIASA reports petrol/diesel sales of 20.763 bn litres for 2024. Editions differ; this demand proxy remains unverified and is not imports plus exports.

### 03 | Production and stocks remain open

Production and stocks remain unresolved. The proposed 3-4 bn litre diesel gap is a hypothesis, not measured consumption.

## To resolve next

Manish: rebuild the balance CSV from SARS; match product, year, actual output and stock changes. Nigel: agree the sales selection and obtain customer/port evidence.

## S2. Three provinces account for 69% of reported fuel sales; the top two contain Vopak's storage facilities

Petrol + diesel sales by province | 2022, bn litres/year

What the evidence shows

### 01 | Demand is concentrated

Gauteng, KwaZulu-Natal and Western Cape account for 68.6% of reported 2022 petrol/diesel sales.

### 02 | Four reporting regions

Eastern coast: EC/KZN. Inland: GP/FS/LP/MP/NW. Western coast: WC. Other: NC. Boundaries are reporting groups.

### 03 | Sales locate the historical market

Colours show provincial sales totals, not density or customer catchments. Only Durban and Lesedi are labelled; competitor detail is on pages 13 and 15.

### To resolve next

Nigel: confirm customer markets for Durban and Lesedi. Manish: retain the observed 2022 map; present later estimates separately with national-source flags.

## S2. Reported fuel sales were broadly steady through 2022, despite the pandemic dip

### Annual provincial sales | 2013–2022, bn litres/year

### What the evidence shows

#### 01 | Gauteng remains the largest market

The reported series places Gauteng above the other provinces throughout 2013–2022. Volumes differ across the smaller markets.

#### 02 | Later provinces are estimates

2024 petrol estimates: Gauteng 3.47, KZN 1.47, Western Cape 1.41 bn L. These hold 2022 shares; no later observed provincial sales were found.

#### 03 | Historical differences are traced

Manish fixed the 2013 parser and traced 2015 to a source revision. Decisions remain on 2014 conflicts and incomplete 2018 coverage.

### To resolve next

Manish: reconcile source selections and retain estimate labels. Nigel: decide whether estimated petrol volumes belong in the outlook; diesel booking shares are less stable.

# S1. Provincial demand is known; its supply origin still needs evidence

## 2022 sales totals | ILLUSTRATIVE domestic/import allocation

Units: bn litres/year. Imported/domestic segments are a scenario illustration, not measured provincial flows.

Source: DMPR 2022 provincial sales totals; source mix from the existing illustrative national-balance CSV. Not observed origin.

Strictly Confidential

## What the evidence shows

### 01 | Demand totals are sourced

The provincial bars use reported 2022 petrol/diesel sales.

### 02 | Origin shares are illustrative

Domestic/import fractions are authored examples; no actual provincial origin allocation is established.

### 03 | Imports need a national balance

Exports and stock movements must be reconciled before a sourced import requirement can be presented.

## To resolve next

Manish: populate the matched-year national balance first; retain provincial origin as unknown until supported.

## S/C3. Activity trends show potential demand shifts; fuel used per unit of activity still needs validation

Potential demand levers | 2024 = 100; price panel uses nominal R/litre

Observed proxies, not fuel-volume effects. Activity axes 0–120; EV 0–400; prices 0–30 R/L.

Passenger travel | all-fuel stock, Dec

Agriculture | real value added, CY

Mining | production volume, CY

Electrification | annual new sales, CY

Freight demand | payload, CY

Manufacturing | production volume, CY

Diesel power | OCGT generation, FY

Price response | annual nominal R/litre

Note: Latest staged: activity Jul 2026; GDP Q2 2026; inland prices Oct 2026. Charts use complete years. Fuel-use rates need validation; FY ends March.

Source: NaTIS; Stats SA P0441 / P2041 / P3041.2 / P7162; Eskom; naamsa; DMPR / CEF. Snapshot manifest in notes.

Strictly Confidential

## C4. Refinery capacity has fallen; redevelopment remains conditional

### Published footprint + illustrative scenarios | thousand bbl/day

History 2016–2025 is sourced; 2026 onward is illustrative, not a forecast

#### A | No new refinery capacity

2036: 358 thousand bbl/day

#### B | Conditional CEF redevelopment

2036: 758 thousand bbl/day

Reported FY2024 output: Secunda 29.1; Natref Sasol share 17.8 million barrels.

### What the evidence shows

#### 01 | Capacity has fallen

Published capacity falls from 718 to 358 thousand bbl/day between 2020 and 2022. Redevelopment remains conditional.

#### 02 | Reported output is different

FY2024 Secunda output is 29.1 million barrels; Natref is 17.8 for Sasol's share. Both cover all products and a year to June.

#### 03 | A product bridge is needed

Match product yields, calendar years and downtime before calculating import effects. Capacity does not measure actual output.

### To resolve next

Manish: match operator output to product/year and document Natref ownership basis. Henry: review technical mechanisms. Nigel: agree refinery scenario timing.

# S/C3 / C4. L/M/H assumptions define coherent demand, supply and customer-access worlds

## Scenario design | all key levers and assumptions

| Input family            | L/M/H settings to agree                                                                                                    | Outputs and decision                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| Demand                  | Growth, mileage, fleet efficiency/EVs, freight/passenger rail, grid/private generation, sector activity and price response | Petrol/diesel demand by year and region                           |
| Supply and trade        | Plant output, yields, downtime/compliance, imports, neighbouring-country exports and stocks                                | Domestic supply, trade and transit throughput; residuals explicit |
| Customer access         | Delivered price, service, feasible routes, rights and switching                                                            | Reachable and competitively accessible customer litres            |
| Capacity and operations | Usable tanks, receipt/dispatch, inventory policy, peaks and spare space                                                    | Unique Vopak flows and any usable-capacity gap                    |

## Combine settings into coherent worlds

|                              |                                           |                                                   |
|------------------------------|-------------------------------------------|---------------------------------------------------|
| Baseline                     | Ample supply                              | Tight supply                                      |
| Agreed reference assumptions | Supply and access comfortably meet demand | Demand tests available supply and delivery routes |

Note: History is observed; forecast cases are proposed. No new fuel forecast is shown until the assumptions, source selections and back-tests are reviewed.

Source: Authored forecast framework; observed series in reporting evidence snapshots. No new growth rates or fuel forecasts inferred.

Strictly Confidential

## C5. Transport cost shapes the market Durban and Lesedi can reach

### Illustrative road cost, R/litre

Example rate: R0.15/L dispatch + R0.002/L/km. Grey = unassessed.

### What the evidence shows

#### 01 | Darker means lower transport cost

Cells show example road cost from Durban or Lesedi. The rate is illustrative and excludes fuel price, storage and pipeline tariffs.

#### 02 | Grey means unassessed

Grey areas have no assessed road connection under this illustration. They are not confirmed to be inaccessible.

#### 03 | A cost surface is a first screen

Pipeline and rail lines are context. Route capacity, product compatibility and customer rights still determine serviceable demand.

### To resolve next

Nigel: select the first customer destination and cost threshold. Manish: replace example rates with dated route costs and access evidence.

## C5. Compare Durban, Matola and Walvis Bay for the same inland customer

### Durban, Matola and Walvis Bay | schematic corridor comparison

Shading: provincial petrol + diesel sales, 2022 (bn litres/year)

Note: Routes schematic; access unverified. Colour measures provincial totals, not density or Vopak share.  
Source: DMPR 2022 sales; NAMCOR NOSF; Galp GIMTL; WBCG / TRAC corridors; Natural Earth. Capacities and URLs in notes.  
Strictly Confidential

### What the evidence shows

#### 01 | Vopak has a South African footprint

Durban and Lesedi are highlighted against 2022 provincial sales. Colour shows sales totals; it does not establish Vopak market dominance.

#### 02 | Matola has published fuel storage

Galp/IPG GIMTL lists 60,000 m<sup>3</sup> of petrol/diesel tanks, plus 6,000 m<sup>3</sup> LPG excluded here. N4 is the eastern inland comparison route.

#### 03 | Walvis has storage and handling

NAMCOR NOSF lists 75,000 m<sup>3</sup> in total, including 65,000 m<sup>3</sup> petrol/diesel. Trans-Kalahari is the western inland comparator.

### To resolve next

Manish: verify available tanks, customer access and full delivered costs. Source Namibia/Mozambique demand before extending the heatmap; grey means unassessed.

## R6. Separate market demand, accessible volume and unique Vopak deliveries

### Market screens | illustrative bn litres/year

Successive screens; these volumes are illustrative

### Count Durban-Lesedi transfers once

Durban 2.8 + Lesedi 2.0 – shared transfer 1.8 = unique 3.0

Demand ≠ terminal receipts ≠ storage capacity. Incremental opportunity is on page 14.

### What the evidence shows

#### 01 | Count customer demand once

Example receipts of 2.8 at Durban and 2.0 at Lesedi include a shared 1.8 transfer. Unique demand served is therefore 3.0 bn litres.

#### 02 | Accessibility precedes opportunity sizing

Example catchment demand 14.5 → physically feasible 12.0 → commercial envelope 8.5. Each screen requires evidence.

#### 03 | Examples are separate from sales

These market volumes illustrate the calculation. They are not the reported 2022 regional totals or actual Vopak deliveries.

### To resolve next

Nigel: request customer deliveries, destinations and transfer records. Manish: calculate unique served demand before estimating additional access.

## R6. Vopak's published tanks sit in the two largest regional demand markets

### Historical demand and published tanks | separate scales

— no listed Vopak site ? capacity unknown

Demand is annual flow; capacity is a stock. 1 million m³ = 1 bn litres. Partial gross inventory, mixed products and missing capacities; turnover and customer flows are needed to establish served demand.

[1] Vopak [2] Bidvest [3] Burgan [4] Shell [5] NERSA [6] Sasol [7] Transnet

Source: DMPR 2022 provincial petrol/diesel sales; public operator sources [1-7], checked 6 Oct 2026. Share not established.

Strictly Confidential

### Regional competitor evidence

#### 01 Eastern coast

Vopak: Durban [1]. Bidvest: Durban and Richards Bay [2]; mixed-product capacity.

Transnet: Ladysmith lease tanks [7].

#### 02 Inland

Vopak: Lesedi [1]. Bidvest: Isando [2].

Sasol: Alrode, Pretoria West, Waltloo, Sasolburg [6].  
Transnet: Tarlton / Jameson Park + four lease sites [7].

#### 03 Western coast

Burgan Cape: Cape Town petrol/diesel terminal [3].  
Confirm current tank availability and customer access.

#### 04 Other / Northern Cape

Operator coverage incomplete. Check Shell site notices [4] and NERSA licences/access records [5].

## R6. Reach and commercial access narrow the illustrative customer opportunity

### Illustrative reach and volume bridge | bn litres/year; customer capture unverified

Durban and Lesedi: illustrative road reach

Darker shading = lower example road cost. Physical and commercial access remain unverified.

Illustrative volume waterfall

The example leaves 5.5 bn L/year of candidates to test for cost, service, usable capacity and customer rights.

## R7. Durban leads the published storage subset

### Published storage by location | thousand m<sup>3</sup>; mixed capacity bases

One shared scale for every location

Small lease bars reflect smaller tank volumes; they are not operating supply.

### What the evidence shows

#### 01 | Capacity is a stock

Published tank volumes are not annual fuel deliveries or market share.

#### 02 | The inventory is partial

Missing capacities are unknown, rather than zero; mixed product scopes limit comparison.

#### 03 | Leases are conditional

Transnet lease tanks are not counted as currently available operating supply.

### To resolve next

Manish: verify product compatibility, capacity basis and operating status. Nigel: confirm usable client capacity.

## R7. Prioritise customer markets, win on service and cost, then expand

### Market outlook | priority hypotheses and conditional timing

|  |  |             |                     |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Where to play                                                                     | How to win                                                                        | When to act                                                                                    | What must be true                                                                                      |
| Durban coastal customers<br>First market to test                                  | Competitive delivered cost; reliable receipt and dispatch; compatible tanks       | Now: identify customers and test service using existing assets                                 | Named customer, product and unique litres; cost threshold; usable tank and dispatch space              |
| Lesedi inland customers<br>First inland market to test                            | Reliable inland supply; competitive full-route cost versus other gateways         | After route and customer validation: negotiate incremental flows                               | NMPP or alternative route access; receipt/dispatch capacity; customer rights and switching             |
| Matola / Walvis Bay port-storage gateways<br>Compare inland supply routes         | Test storage, handling and transport to the same inland destination               | During the inland comparison; pursue an opportunity only if access and economics are evidenced | Available compatible tanks; border/route feasibility; partner and customer access; full delivered cost |

#### Investment gate

New storage follows secured incremental flows and a gap in usable capacity; the illustrative 5.5 bn litres does not establish a commitment.

Nigel: Choose the first customer/product and acceptable cost. Confirm the service proposition and commercial access.

Manish: Build a customer-by-route evidence table: litres, cost, capacity, rights, timing and owner. Mark each gate passed, failed or unassessed.

Source: Authored market hypotheses; demand, gateway and storage evidence on pp.4, 10–15. Customer capture remains unverified.

# Appendix

---

**The main story ends on page 16.**

Document scope · Henry storyboard responses · supporting presentation palette

Use the supporting material to trace the evidence, assumptions and remaining work behind the outlook.

# About this document

---

## What it covers

---

South Africa petrol/diesel market baseline, historical demand and national supply/trade evidence.

Demand drivers, refinery alternatives and L/M/H scenario design for all key levers and assumptions.

Vopak customer opportunities through infrastructure reach, delivered price, service and commercial access.

Preliminary inventory sensitivities and a trace of the evidence needed to answer Henry's storyboard.

## What it does not establish

---

A validated 2026 forecast or calibrated L/M/H scenario results; assumption ranges and back-tests remain work to do.

Measured Vopak market share, confirmed customer capture or verified operational catchments.

A closed national fuel balance, complete fuel-compatible storage census or confirmed spare tank capacity.

An investment recommendation, detailed engineering design or approved commercial business case.

Week 1 working assessment, 6 October 2026. Observed data, estimates, conditional cases and illustrations are distinguished. Source gaps and proposed actions remain explicit; governance coverage is not data validation or business approval.

# R7. Inventory policy determines the working stock needed for additional flows

Working inventory, thousand m<sup>3</sup>

Illustrative: 5.5 bn litres/year; uniform daily flow

Inventory days

Working stock, not new capacity: allow for spare tanks, peaks, product segregation, tank heels and dispatch limits.

Source: Existing 5.5 bn L/year candidate example; authored inventory-day sensitivity, 6 Oct 2026. Not new-capacity sizing.

# S1 / S2 / S/C3 / C4. Henry storyboard answers | Market baseline

## S | Every prompt addressed; partial and open findings require the stated evidence

| Henry storyboard prompt                             | Current answer / evidence gap                                                                                            | Deep dives                       |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| Total SA demand development                         | Partial: reported 2024 sales are 20.763 bn L; coverage awaits reconciliation. Provincial history ends in 2022.           | <a href="#">3 / 4 / 5</a>        |
| Eastern SA market within economic striking distance | Open: location and illustrative costs show reach, not accessible customer litres. Need destinations, tariffs and rights. | <a href="#">4 / 10 / 12 / 14</a> |
| Greater diesel use in power generation              | Partial: generation history is shown; recent OCGT use falls. Diesel-litres attribution still needs fuel-use evidence.    | <a href="#">7 / 9</a>            |
| Rail to road                                        | Partial: road/rail payload history is shown. Payload alone does not prove modal substitution or diesel effects.          | <a href="#">7 / 9</a>            |
| Changes in fuel price                               | Partial: complete-year price history is staged. Travel response and real-price effects remain uncalibrated.              | <a href="#">7 / 9</a>            |
| More fuel-efficient vehicles                        | Open: fleet stocks and new EV/hybrid sales do not establish fleet efficiency. Need fuel mix, mileage and intensity.      | <a href="#">7 / 9</a>            |
| Slow GDP growth                                     | Partial: GDP and sector activity evidence is available; growth-to-fuel effects require explicit assumptions.             | <a href="#">7 / 9</a>            |
| Refinery closures                                   | Partial: published capacity falls to 358 thousand bbl/day. Capacity is distinct from output and operating availability.  | <a href="#">8</a>                |
| Challenges at Secunda                               | Partial: FY2024 output is 29.1 million barrels, all products. Availability and petrol/diesel yields remain open.         | <a href="#">8 / 9</a>            |
| Closure of Moss gas                                 | Open: plant-specific shutdown dates, operating status and lost product output need explicit source confirmation.         | <a href="#">8 / 9</a>            |
| Growth in imports and where they enter              | Partial: 2024 net imports are 13.078 bn L. Import-growth attribution, product-specific ports and origin remain open.     | <a href="#">3 / 6</a>            |

## S/C3 / C4 / C5. Henry storyboard answers | Market changes

### C | Every prompt addressed; partial and open findings require the stated evidence

| Henry storyboard prompt                         | Current answer / evidence gap                                                                                             | Deep dives                   |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Road to rail; private-sector rail projection    | Open: historical payload is available; private-sector service, timing and modal-shift assumptions need evidence.          | <a href="#">7 / 9</a>        |
| End of loadshedding and spare power capacity    | Partial: observed OCGT generation falls. Future dispatch, spare capacity and diesel demand remain conditional.            | <a href="#">7 / 9</a>        |
| EV / HEV penetration projection                 | Open: sales uptake is shown, not fleet penetration. Separate BEV, PHEV and conventional hybrids; model turnover.          | <a href="#">7 / 9</a>        |
| Effect of EV / HEV on litres per km             | Open: require stock mix, mileage and fuel intensity. BEVs and hybrids have different fuel-use mechanisms.                 | <a href="#">7 / 9</a>        |
| Higher fuel prices and km travelled             | Open: prices are sourced; mileage response and elasticity must be specified and tested before forecasting.                | <a href="#">7 / 9</a>        |
| Mega refinery / SAPREF restart                  | Conditional: redevelopment capacity is a scenario, not sanctioned output. Confirm FID, ramp-up and product yields.        | <a href="#">8 / 9</a>        |
| Secunda gas, coal and MRG diversion to 2032     | Open: no liquid-fuel displacement is inferred. Need dated gas allocation, plant mechanism and product-output evidence.    | <a href="#">8 / 9</a>        |
| Natref future?                                  | Open: reported FY output is available; future ownership, availability and product yields require a dated case.            | <a href="#">8 / 9</a>        |
| Durban storage / NMPP / Lesedi vs road and rail | Open: compare the same customer and product. Need full delivered costs, capacity, tariffs and service availability.       | <a href="#">10 / 11 / 14</a> |
| Transport from Matola and Walvis Bay            | Partial: gateways, published storage and schematic routes are shown. Full costs, borders and customer access remain open. | <a href="#">11 / 14 / 16</a> |

## R6 / R7. Henry storyboard answers | Vopak outlook

### R | Every prompt addressed; partial and open findings require the stated evidence

| Henry storyboard prompt                 | Current answer / evidence gap                                                                                                       | Deep dives                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Market share of Vopak in Dbn and Lesedi | Open: published storage is an asset footprint, not served demand. Need unique deliveries, transfers and matched demand.             | <a href="#">12 / 13 / 14</a> |
| Potential scope for new investment?     | Conditional: prioritise customer flows and service first. New storage requires secured incremental flows and a usable-capacity gap. | <a href="#">15 / 16 / 19</a> |

# Agree priorities and next steps
